

## ZEDI ACCESS TACTICAL RELEASE

### ZEDI ACCESS ENHANCEMENTS

Gain more insight with Zedi Access and our new enhancements. Zedi continues to improve the platform based on the feedback that you have provided. We are always looking for ways to make your user experience better.

#### What's new in Zedi Access?

- Oil Well Test: Well test can be added for a Child location in different Parent locations.

#### When is this happening?

- September 22, 2016 - **no downtime will be required**

#### Where can I find this change?

1. Enter the Oil Well Test on Zedi Access, select the Well Manager tab.

2. The user now has 2 options in Add Test Well

There you can create a new location which is the same as previously done. This is completed by adding a Location Name/LSD and a Location UWI then clicking save.

Also, there is now a “Search existing location” link, as seen below.

To utilize the new “Search existing location”,

- User must search by a UWI and search for a Smart-Alek location existing within their company.

**Please Note:** 3<sup>rd</sup> party access is excluded.

Once appropriate UWI is located select the location from the search result, existing child location’s information is shown as below and will inform you the following:

- Child location’s name
- Attached to Satellite names. It is possible to have more than 2 parent locations.

Add Well Location

Search by UWI (min 3 chars)  
 [Create new location](#)

Location Name  
 lilytest-Child03

Attached to satellite(s)  
 01-04-027-03W5 Test Sep  
 01-20-029-26W4 Test Sep A

[Cancel](#)

After pressing the Save button, the child location is now added to the satellite.

It can be edited and deleted (if there is no well test created for it).

- To view which well test has been completed with which parent location:
  - A well test report tested in another parent location is now shown in a light blue color. Move the mouse over the location name, the tooltip shows the name of parent location that the report was tested on as indicated by arrow below.
  - The well test report tested in the current parent location is shown in black, as normal.
